

Amendments To the Claims:

1-10. (canceled)

11. (currently amended) A web server comprising software modules and an expansion module which provides the functions of a programmable logic controller, wherein Internet protocols are provided for communication between the software modules and for communication between the software modules and components outside of the web server, the server providing through the expansion module a first mechanism for implementing an automation functionality, wherein the server is enabled, via connection through the expansion module to one or more automation devices, to control at least one device taken from the group consisting of a computer numerical control device, a valve and a drive, the server further providing a mechanism to directly access the real-time communication level of a real-time Ethernet, wherein the expansion module is connected to an input/output module of an automation system and wherein the web server comprises a connection to a communication network.

12. (canceled)

13. (previously presented) The web server according to claim 12, wherein the communication network is the Internet.

14. (canceled)

15. (previously presented) The web server according to claim 12, wherein Internet protocols are provided for communication between the software modules and for communication between the software modules and components outside of the web server.

16. (previously presented) The web server according to claim 11, wherein the web server is adapted for configuration and administration of the software modules.

17. (previously presented) The web server according to claim 12, wherein the web server is adapted for configuration and administration of the software modules.

18. (previously presented) The web server according to claim 14, wherein the web server is adapted for configuration and administration of the software modules.

19. (previously presented) The web server according to claim 11, wherein the expansion module comprises a connection to an industrial automation system.

20 - 22. (canceled)

23. (previously presented) The web server according to claim 11, wherein the web server comprises a connection to the Internet via a firewall.

24. (previously presented) The web server according to claim 11, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

25. (previously presented) The web server according to claim 12, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

26. (previously presented) The web server according to claim 14, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

27. (previously presented) The web server according to claim 11, wherein the web server comprises a real-time operating system.

28. (previously presented) The web server according to claim 12, wherein the web server comprises a real-time operating system.

29. (currently amended) An automation system comprising a web server having software modules including an expansion module that provides the functions of a programmable logic controller, wherein Internet protocols are provided for communication between the software modules and for communication between the software modules and components outside of the web server, the expansion module providing an automation functionality with connection to an input/output module of an automation system wherein the server is enabled, via connection through the expansion module to one or more automation devices, to control at least one device taken from the group consisting of a computer numerical control device, a valve and a drive, and the server further comprising a connection providing direct access to the real-time communication level of a real-time Ethernet.

30. (canceled)

31. (previously presented) The web server of claim 11 wherein the expansion module is a controller of components and processes, wherein the web server includes a TCP/IP stack and wherein direct access to the real-time communication level is effected by a direct connection between the TCP/IP stack and an automation device with communication by means of a TCP/IP-based real-time ethernet protocol.

32. (previously presented) The automation system of claim 29 wherein the expansion module is a controller of components and processes, wherein the web server includes a TCP/IP stack and wherein direct access to the real-time communication level is effected by a direct connection between the TCP/IP stack and an automation device with communication by means of a TCP/IP-based real-time ethernet protocol.

33. (canceled)
